

## **Web2Print**

The SolPrint XN Customer Portal has now been enhanced to incorporate iteba's own Web2Print functionality.

Stock can be identified as Print on Demand items with variable data PDF templates.

At the point the items are ordered the Customer is prompted to enter variable data defined on the Stock Code. In real-time the personalised PDF is displayed and the resulting file stored against the order for submission into the internal production workflow or so it can be made available to the Supplier for download through their Supplier XN Portal.

SolPrint can be setup to automatically create the production job or purchase order to manage the print production process whether internally or externally produced.

Optional integration with credit card payment systems allows non-account customers to order standard stock items whether incorporating variable data or not.

If your MIS cannot provide you with these benefits you could be losing out to your competitors.

Why not contact us now for a no obligation demonstration where we can show you how the SolPrint Management Information System could be implemented within your operation.
